

Values and Principles of Organicrops

We live in an era when consumers want to be certain that what they consume is good, not only for them but for the planet, so companies must investigate where their ingredients come from, all the way to the farm.

The supply chain is getting involved in this endeavor as consumers are becoming more demanding in getting to know the origin of the products they consume.

It is imperative to replace hydrogenated fats with healthier alternatives in products where a hard fat is essential, and the best, natural option is palm oil.

The demand for palm oil will only grow and it is vital that producers could respond to this demand from the market supplying ingredients that are not only healthy, but that are produced in a sustainable, respectful way, caring for the planet, the community and the small farmers.

Due to the disastrous way palm oil plantations have been developed in the South East of Asia palm oil and the sourcing of palm oil is widely condemned. At Organic Supply we believe that the standards for certifying the sustainable production of palm oil established by RSPO, even though are designed to reach sustainability in the industry, are not enough and must further focus in the needs and reality of small farmers, that is why we go a step further and produce ORGANIC Palm Oil, which guarantees a healthy soil, water and air, as well as balanced ecosystem where beneficial insects and microorganisms thrive.

There is some truth in claims that palm oil production has caused a disaster for tropical rainforests and in Southeast Asia it has destroyed the habitats of orangutans and tigers (logging interests go there first and destroy the forest before plantations are established), however alternatives like soy or rapeseed or corn are definitively worse because these crops are much more land-hungry and each harvest requires the clearing of large tracts of land with the consequent destruction of any biological web that may exist there.

Organic is the way to go, but not only organic but also small-scale organic production, avoiding monoculture by integrating other crops along with the oil palms, so that a healthy ecosystem could develop within the plantations helping the resurgence of biological control.

This reduces the need to apply products to control pests or diseases and gives a big boost to the environment.

At Organic Supply we produce Palm Oil with the conviction that it must be good for the planet, good for the consumer and good for the small-farmer. We will never walk away from that way of production. It is essential for all of us. It is essential for the survival of our planet. We guarantee the best organic, sustainable Palm Oil. A palm oil you can count on being good for you and your customers.
